DETAILED ACTION

Drawings

The drawings are objected to as failing to comply with 37 CFR 1.84(p)(5) because they do not include the following reference sign(s) mentioned in the description: There is a reference number missing in Fig. 9 between 51b and 38a. It appears it should be 38c next to the line without the reference number. Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. Each drawing sheet submitted after the filling date of an application must be labeled in the top margin as either "Replacement Sheet" or "New Sheet" pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Application/Control Number: 10/521,537

Art Unit: 3767

Claims 1-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fowles et al. (US Patent No. 5,989,237) in view of Cloyd (US Patent No. 3,916,894). Fowles discloses the device substantially as claimed including an activation head (Fig. 4, 116) open at one end (140) thereof and closed by a pierceable membrane (directly below 73) at another end thereof; a needle shield (40) closed at one thereof (58) and open at a base (46 and 71) thereof, said base fitting and sliding in a rail (112) of said activation head; a needle (34) having a double-pointed cannula secured to a hub (71) disposed inside said rail of said activation head; an activation indicator on said rail of said activation head for indicating an initial resting position of said hub of said cannula in said activation head in which said pierceable membrane is intact; a needle shield (42) slidable inside said activation head from said initial resting position to a final activation position (Fig. 3) for acting on said hub and sequentially piercing said pierceable membranes with said inner point of said needle and connecting said cannula to said reservoir or said vial.

Fowles further discloses two retainers (46) for stopping said needle hub before activation and for locking said needle hub in position after activation (Fig. 3, 122). Fowles also discloses the needle shield having a thicker ring (56) acting as a stop against a top of said activation head during activation. Fowles further discloses the activation head having an inner narrower diameter (71) defining a stop for allowing said cannula to pass while stopping said hub. Fowles further discloses having a flange (118) to grip the device during operation. Fowles further discloses the activation head being stiffened at said base by at least one radial flap (88). Fowles also disclose the

Art Unit: 3767

activation head having a smooth internal surface (107) facilitating sliding of said needle hub (71) by pressing upon said needle shield (Fig. 3).

Fowles, however, does not disclose a sliding plunger within a rigid vial. Cloyd discloses a rigid vial (Fig. 1, 12) having a reservoir containing the drug and having a sliding plunger (15) hermetically sealing said vial, said plunger adapted for attachment to said another end of said activation head (plunger attaches to (8)) for making contact between a pierceable membrane of said plunger (26) and the pierceable membrane of the activation head (see Fig. 4, below 73 in Fowles). Cloyd further discloses that the activation head and said plunger have complimentary threading (9 and 16). Cloyd also discloses that the plunger is made of rubber. Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to have modified Fowles with the vial with sealed plunger, as taught by Cloyd, in order to provide a system which is compact and works with just two components for ease of use and assembly.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Laura C. Schell whose telephone number is (571) 272-7881. The examiner can normally be reached on Monday-Friday 8am-4:30pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kevin Sirmons can be reached on (571) 272-4965. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
